Motorize innovation

Personalized high-tech motors for original motor car equipment

Window regulators, sunroofs, blinds, steering wheel, robotized gears, seat adjuster... If today you just need a touch to change the look of the passenger compartment, merit is due to the people “behind the scene” setting up technologies to automatize each single mechanism. For 25 years, Unus International has been producing motors and ratio-motors for original equipment in the car sector and automation for the civil and industrial sector. An upward process begun in 1986 and progressively consolidated in the motor car sector. 2001 marked a turning point towards internationalization, now a typical feature of the business, with a production capacity at 2 million between mo-

tors and ratio-motors and with a consolidated turnover of around 13.5 million Euro, 90% being from export. Figures commanding respect and achieved thanks to a policy aimed at boosting the product’s technological content and capacity for personalization. “The high quality standard of our products is a cornerstone of our concept – the general manager Massimo Melato explains – where we devote commitment and resources through continual research. In-house organizational efficiency assures flexibility in design and production, with automatic but flexible production lines, designed to range from one article to another and produce batches in small numbers”. It is no

Massimo Melato

wonder that Unus International is a second tier supplier to the principal motor car manufacturers, from Audi to Volkswagen up to Porsche, Bentley, Mercedes and BMW.
